1 Problem

In triangle ABC with vertices $\mathbf{A} = \begin{pmatrix}2\\3\end{pmatrix}$, $\mathbf{B} = \begin{pmatrix}4\\-1\end{pmatrix}$ and $\mathbf{C} = \begin{pmatrix}1\\2\end{pmatrix}$, FInd the equation and length of altitude from vertex $\mathbf{A}$

2 Solution

1) Direction vector of side BC

$$\mathbf{m} = \mathbf{B} - \mathbf{C} \tag{2.0.1}$$

$$= \begin{pmatrix}3\\-3\end{pmatrix} \tag{2.0.2}$$

Direction vector of side BC is normal of altitude from $\mathbf{A}$

2) Equation of the altitude

$$\mathbf{m}^\top (\mathbf{x} - \mathbf{A}) = 0 \tag{2.0.3}$$

$$\begin{pmatrix}3 & -3\end{pmatrix}\mathbf{x} = -3 \tag{2.0.4}$$

$$\begin{pmatrix}1 & -1\end{pmatrix}\mathbf{x} = -1 \tag{2.0.5}$$

3) Equation of line BC

$$\mathbf{x} = \mathbf{B} + \mu\mathbf{m} \tag{2.0.6}$$

$$\mathbf{x} = \begin{pmatrix}4\\-1\end{pmatrix} + \mu\begin{pmatrix}3\\-3\end{pmatrix} \tag{2.0.7}$$

$$i.e.\ \ \begin{pmatrix}1 & 1\end{pmatrix}\mathbf{x} = 3 \tag{2.0.8}$$

4) Optimization problem
The length of altitude can be expressed as a optimization problem,

$$\min \|\mathbf{A} - \mathbf{x}\|^2 \tag{2.0.9}$$

such that

$$\mathbf{n}^\top \mathbf{x} = c \tag{2.0.10}$$

where,

$$\mathbf{n} = \begin{pmatrix}1\\1\end{pmatrix} \tag{2.0.11}$$

$$c = 3 \tag{2.0.12}$$

(2.0.9) is solved using Gradient Descent in `codes/11.10.3.17.py`.

5) Update equation for gradient descent
Here, function to be minimized is

$$f(\mathbf{x}) = \|\mathbf{A} - \mathbf{x}\|^2 \tag{2.0.13}$$

$$\tag{2.0.14}$$

Gradient of this function is

$$\frac{\partial f(\mathbf{x})}{\partial \mathbf{x}} = 2(\mathbf{x} - \mathbf{A}) \tag{2.0.15}$$

But due to the constraint, only the component orthogonal to $\mathbf{n}$ is considered. Hence, the gradient is updated as

$$\text{grad} = -2\frac{\mathbf{m}^\top (\mathbf{x} - \mathbf{A})}{\|\mathbf{m}\|}\mathbf{m} \tag{2.0.16}$$

$$\tag{2.0.17}$$

The parameter $\mathbf{x}$ is updated using the following equation,

$$\mu = \mu - \alpha \times \text{grad} \tag{2.0.18}$$

$$\tag{2.0.19}$$

Where α is the learning rate.
The results obtained are using 0.01 as learning rate, iterated until the diffrence between cost in consecutive iterations is lesser than 5×10^{-7}.
The results obtained are:

$$\mathbf{x}_{min} = \begin{pmatrix}1.00039877\\1.99960123\end{pmatrix} \tag{2.0.20}$$

$$\min \|\mathbf{A} - \mathbf{x}\|^2 = 2.000000318 \tag{2.0.21}$$

Therefore, the length of altitude is given by,

$$l = \sqrt{2} \approx 1.414213562 \tag{2.0.22}$$

Parameter	Value	Desription
A	$\begin{pmatrix} 2 \\ 3 \end{pmatrix}$	Vertex 'A' of the triangle
B	$\begin{pmatrix} 4 \\ -1 \end{pmatrix}$	Vertex 'B' of triangle
C	$\begin{pmatrix} 1 \\ 2 \end{pmatrix}$	Vertex 'C' of triangle
learnRate	0.01	Learning rate of the model
